

New Diagnosis Method Speeds Polio Treatment

—Globe and Mail.

Sure diagnosis of polio is a vital factor in treatment, yet there have long been cases of the disease that were difficult to prove. At the Hospital for Sick Children, a laboratory worker removes from a centrifuge sample from suspected child to be inserted into tube containing growing tissue.

Doctors urge parents to observe cleanliness in effort to guard against polio infection and warn that no mass immunization is available yet. Better diagnosis and treatment are available for little patients such as Pamela, above with Dr. Peach and Joseph Zammit, a stretcher-bearer, who is seen leaving hospital for trip to hospital's polio rehabilitation centre at Thistleton.
